

Rough notes on TLS certs for *.gitlab-review.app

Actual repos are changing, but it looks like the new single master repo (**gitlab**, was **gitlab-ee**) will be using *.gitlab-review.app for it's GKE k8s hosted review apps.

The cert for this is stored in a K8S secret. To replace this when it expires:

1. Assume sslmate has autorenewed this
2. sslmate download '*.gitlab-review.app'
3. Assume the key has remained the same; it's in the secret, and can be left
4. `cat '\*.gitlab-review.app.chained.crt' |base64|tr -d '\n'`
5. • Save this output somewhere handy, briefly
6. `gcloud container clusters get-credentials review-apps-ee --zone us-central1-b --project gitlab-review-apps`
7. • Assumes you have gcloud and kubectl generally installed and working; this adds a cluster config to your .kube/config file, and sets it to be the current context
8. Save the existing secret: `'kubectl get secret tls-cert -namespace review-apps-ee -o yaml > old-gitlab-review-app.secret`
9. `kubectl edit secret tls-cert --namespace review-apps-ee`
10. Carefully replace the existing tls.crt value with the base64 encoded cert you output above. Leave tls.key alone. Save, quit

This will automatically apply (within a few seconds last time).
