

Workhorse HTTP

Figure 1: Workhorse HTTP

Workhorse Session Alerts

Symptoms

Possible checks

- HAProxy may not be able to keep up
- Gitaly is overloaded
- Gitaly rate-limiting issues

Reference Issues

****2018-11-06:** Up to 15 minute delays on clones from GitLab repositories, including `www-gitlab-com`, `gitlab-ee`, `gitlab-ce`*

- A S2 level incident lasting 3 days, led to disruption to git clones, in particular for the `www-gitlab-com`, `gitlab-ee`, `gitlab-ce` although many others were affected to.
- Diagnosis went around in circles:
 - Initially targeted abuse
 - High CI activity rates
 - Workhorse throughput
 - Network issues
 - Gitaly concurrency limits (which had contributed)
- Smoking gun: not only git clones which were slow, artifact downloads against S3 had also sky-rocket in latency
- Testing git clones and artifact downloads via `https://gitlab.com`, then against front-end load balancers, then again Workhorse helps us pinpoint the issue with the HAProxy front-end fleet.
