

FogBugz Importer Runbook

Summary

The FogBugz Importer allows customers to import issues and project data from FogBugz into GitLab. It uses the FogBugz API to fetch issue data and metadata, providing a migration path for FogBugz users. This runbook provides support engineers with troubleshooting guidance for common FogBugz import failures.

Key Features:

- Imports all cases and comments with original case numbers and timestamps
- Supports user mapping from FogBugz to GitLab
- Can re-import projects to create new copies
- Preserves case status and metadata

Important Notes:

- Only issues are imported (not repositories)
- User mapping must be configured during import
- Users can be mapped to GitLab users or left unmapped (adds full name to description)

Troubleshooting

For comprehensive information about FogBugz importer configuration and user mapping, see the FogBugz Importer Documentation.

Common issues include:

- **Import fails with connection error:** Verify the FogBugz URL is correct and accessible, check SSL/TLS certificates
- **Import fails with authentication error:** Verify credentials are valid and have necessary permissions
- **User mapping not working:** Configure user mapping correctly during import - map each FogBugz user to a GitLab user or leave empty to add full name to description
- **Issues not imported or incomplete:** Check FogBugz API capabilities and user permissions
- **Import hangs or times out:** Monitor Sidekiq progress, increase timeouts, or consider importing in phases for large projects
