

## Making a manual clone of the DB for the data team

This page has information for making a manual clone of the database for the data team. It was a process created in April 2022 related to Reliability/15565 and is based on the notes from Reliability.

This machine currently needs to be remade daily and available by 00:00 UTC each day. The steps should take a total of roughly 1-2 hours though most of that time is waiting. The recreation of the VM should take ~30 min in Terraform.

Once things are complete, we have been commenting in Slack in #data-team-temp-database and on issue 15574. We have been mentioning Ved and Dennis like the comments here: [https://gitlab.com/gitlab-com/gl-infra/reliability/-/issues/15574#note\\_907842307](https://gitlab.com/gitlab-com/gl-infra/reliability/-/issues/15574#note_907842307)

### How to recreate VM from the latest snapshot

The VM that will be destroyed and rebuilt is in the **db-benchmarking** environment.

First in Terraform:

```
tf destroy --target="module.patroni-data-analytics"  
tf apply --target="module.patroni-data-analytics"
```

Note that there should be 10 items to be destroyed and rebuilt, but there are two null items (`module.gcp_database_snapshot.null_resource.contents` and `module.gcp_database_snapshot.null_resource.shell`) which will be destroyed and created on apply. This looks strange, but it is fine. to show what is okay.

### Procedure to reconfigure the patroni-data-analytics cluster after recreating the VM

For SSH to the box: a) make sure your `ssh_config` has the correct bastion:

```
Host *.gitlab-db-benchmarking.internal  
ProxyCommand ssh lb-bastion.db-benchmarking.gitlab.com -W %h:%p
```

- b) then ssh to `patroni-data-analytics-01-db-db-benchmarking.c.gitlab-db-benchmarking.internal`
- c) You may want to start up a tmux session for the rest of these steps...

1. Stop the Patroni service in the nodes with the command: `sudo systemctl stop patroni`
2. Get the cluster name: `sudo gitlab-patronictl list`
3. Remove the DCS entry from the cluster, executing: `sudo gitlab-patronictl remove patroni-data-analytics` Answer the name of the cluster that

will be removed: `patroni-data-analytics` Answer the confirmation message: `Yes I am aware`

4. Change the ownership from the data and log folders in all cluster nodes:

```
sudo su -  
cd /var/opt/gitlab/  
chown -R gitlab-psql:gitlab-psql postgresql/  
chown -R gitlab-psql:gitlab-psql patroni/  
cd /var/log/gitlab/  
chown -R gitlab-psql:gitlab-psql postgresql/  
chown -R syslog:syslog patroni/
```

- 5 - Start Patroni:

```
sudo systemctl start patroni
```

- 6 - Monitor the patroni status and wait until the node is ready:

```
watch -n 1 sudo gitlab-patronictl list
```

- 7 - Once it is ready, collect this information to share:

```
sudo su -  
gitlab-psql  
select pg_last_xact_replay_timestamp();  
exit
```
