

postgres__exporter

We use `postgres_exporter` to collect metrics from a running PostgreSQL server. Metrics collected are internal to PostgreSQL (e.g. tuple statistics or replication progress) and *not* related to the actual data stored (e.g. number of archived projects). For the latter, you may consider extending `gitlab-exporter`.

`postgres_exporter` is deployed by a Chef recipe in the `gitlab-exporters` cookbook.

Defining new metrics

New metrics can be defined in `queries.yml`.

1. Create a new MR with the changes in `queries.yml` and the version in `metadata.rb` bumped.
2. Get the MR approved and merged.
3. Consult the workflow for cookbook changes to get the change deployed to staging and then to production.
