

Access Requests

Add or verify data bag

1. Check ssh key
2. Check unix groups
3. knife data bag from file users.json

Chef Access

```
# on chef.gitlab.com
chef-server-ctl user-create <username> <first> <last> <email> $(openssl rand -hex 20)
# copy the output into <username>.pem and drop it in their home directory on deploy
chef-server-ctl org-user-add gitlab <username>
```

Ops Instance Access

Generally when developers ask for access to the ops instance, we are concerned with chatops access, which requires developer on `gitlab-com` group. If access to any other groups are needed, please clarify with the requester.

Read Only Rails Console Access

When developers ask for access to the rails console, have them submit an access request via Teleport using the Teleport Rails Console Runbook - Then approve that request (if appropriate) using the Teleport Approval Workflow - If the request is for Read/Write access, it's best to give the commands to an SRE and have them run them.

Database Access

When developers ask for access to the production database, have them submit an access request via Teleport using the Teleport Database Runbook - Then approve that request (if appropriate) using the Teleport Approval Workflow - If the request is for Read/Write access, it's best to give the commands to an SRE/DBA and have them run them.
