

Getting setup with Google gcloud CLI

Install

- Install the Google Cloud SDK
 - Using Homebrew `brew cask install google-cloud-sdk`

Authenticate

```
gcloud auth login
gcloud config set project gitlab-production
gcloud auth application-default login
```

This will create a .json file in `$HOME/.config/gcloud/application_default_credentials.json` which will provide default credentials to applications using the Google Cloud SDK
