

Uploads

Intro

Search keywords: attachments, files

Uploads in production are stored in a GCS bucket: <https://docs.gitlab.com/ee/administration/uploads.html#object-storage-settings>

Here's an example of an upload URL: <https://gitlab.com/<full/project/path>/uploads/<secret>/image>

Upload objects in rails are defined here: `./gitlab-ce/app/models/upload.rb`

Managing uploads (deleting, renaming, etc)

At the moment of writing there is no UI for managing uploads: <https://gitlab.com/gitlab-org/gitlab-ce/issues/23553>

Using the console, you can find the upload object in the rails application:

```
upload = Upload.find_by_secret('<secret>')
```

NOTE: This operation will likely time out in production since its search scope is the entirety of the user uploads table.

Do this instead:

```
full_path = 'full/project/path'
project_or_group = Project.find_by_full_path(full_path) || Group.find_by_full_path(full_path)
```

Project is for uploads attached to issues, Group is for uploads attached to epics.

And now that the search scope has been narrowed down to a single project or group:

```
upload = project_or_group.uploads.find_by_secret('<secret>')
upload.path
```

its path in GCS (the storage path consists of two hashes: storage hash and upload's secret):

```
upload.path
```

and delete the upload together with the file on GCS:

```
upload.destroy
```

or rename it:

```
> upload.secret = "<new GUID>"
> upload.path # this path consists of a hash and the upload's secret, it will be used in the
> upload.path = "<path from previous command with upload's secret replaced with the newly generated
> upload.save!
# move file in object storage manually to new path
```

Example

URL of an upload that needs to be removed: <https://gitlab.com/4dface/4dface-sdk/uploads/f7a123bb72bfa73a2d0cf9c12cab99e1/image.png>

1. Get the upload's path on GCS:

```
> project = Project.find_by_full_path('4dface/4dface-sdk')
> upload = project.uploads.find_by_secret("f7a123bb72bfa73a2d0cf9c12cab99e1")
> upload.path
```

2. Check in GCS that the file is present

3. Remove the file from the rails app and GCS:

```
upload.destroy
```

4. Check again on GCS that the file is gone

Example issues

- Rename files in an issue: <https://gitlab.com/gitlab-com/gl-infra/production/issues/887>
- Delete an uploaded file: <https://gitlab.com/gitlab-com/support/dotcom/dotcom-escalations/issues/116>
