

Database Incidents

Below is a checklist to use for responding to database incidents that affect GitLab.com. To use this checklist, create an issue in the infrastructure tracker using the “database_incident.md” issue template. If GitLab.com is not available, use the organization project on dev.gitlab.org. When doing so, make sure to copy the issue to the GitLab.com infrastructure tracker once GitLab.com is back online, then keep that issue up-to-date *instead* of the issue on dev.gitlab.org. This ensures all progress/information is in one spot, instead of being spread across the two different instances.

The title for incident issues should be in the following format:

YYYY-MM-DD: Incident title

Each incident issue should have the following labels:

- ~database
- ~outage, or ~degradation (depending on the type of outage)

You can create a new issue with the right template by clicking [this link](#).
