

ServiceMetrics

This module contains code to generate key service metric indicators at different burn rates.

The metrics are:

- Apdex (for latency)
- Requests (per second)
- Error Rates (per second)
- Saturation and Utilization metrics (as a ratio)

This module should not generate metrics for GitLab.com specifically. Keep GitLab.com specific configuration in the metrics catalog itself when possible.

SLI ownership

Each SLI can be owned by a team and/or a `feature_category`.

Teams are defined in `service-catalog.yml`.

Feature categories are defined in the stage categories stanza in the `stages.yml` file.
